

Update on measurements underground

Stefano Boi

Rome - January 14th, 2019

Experimental setup

- 3 cosmic box enclosed in a wooden box
- 1 Raspberry Pi for DAQ
- 1 UPS for backup

ASTRO

- Scintillator based detector (equipped with SiPM) enclosed in a waterproof suitcase
- Integrate backup battery
- Stand-alone DAQ

Status of measurements

- 1 measurement outside
 - ~48 minutes of acquisition
- 3 measurements underground (one ongoing)
 - 174 m ~71.5 hours ~ 3 days of acquisition
 - 339 m ~ 214.3 hours ~ 9 days of acquisition
 - 512 m ongoing at this time. A few problems during the acquisition

PLANIMETRIA GENERALE
Scala 1:2000

PROFILO GEOSTRUTTURALE
Scala 1:2000

Workforce involved

- Preliminary measurements and studies:
 - 2 Centro Fermi researchers + 1 collaborator
- Underground measurements:
 - 5 Centro Fermi Researchers (one new entry)
 - 5 students + 3 professors from Liceo Scientifico “A. Pacinotti” (CAGL-01)
 - Carbosulcis S.p.A. employees for technical support during operations underground
- Technical support:
 - Daniele Monteleone for DAQ development and technical support
 - 4 undergraduate students for a few support in devices development
 - ...

Statistical significance

Depth (m)	Rate (N/T) [Hz]	Significance (\sqrt{N}/N)	Rate (λ) [Hz]	Significance ($\delta\lambda/\lambda$)
0	3.80 (4)	0.010	3.83 (4)	0,009
174	$5.5(1) \cdot 10^{-3}$	0.027	$5.4(2) \cdot 10^{-3}$	0,030
339	$1.1(4) \cdot 10^{-3}$	0.034	$1.13(4) \cdot 10^{-3}$	0,034
512	$8.1(3) \cdot 10^{-4}$	< 0.043	$8.0(4) \cdot 10^{-4}$	< 0,046

Measured rate w.r.t. rock overburden

Measured rate normalized to the ground level w.r.t. rock overburden

Rate suppression w.r.t. rock overburden

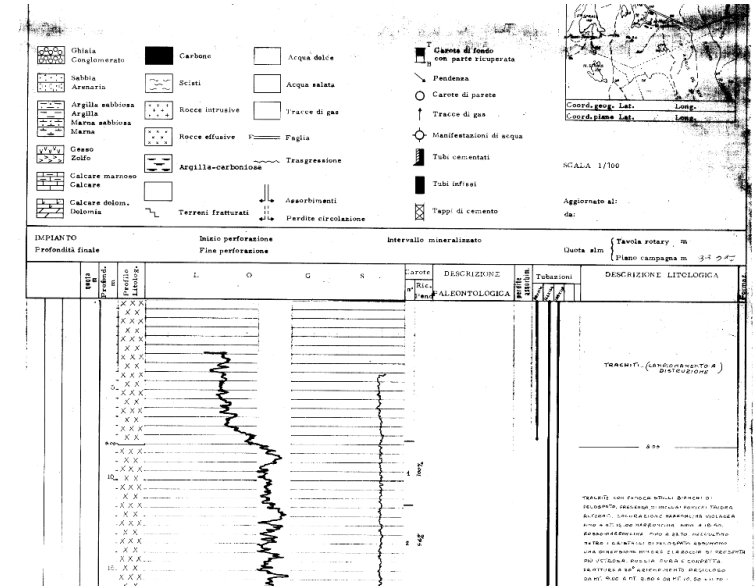

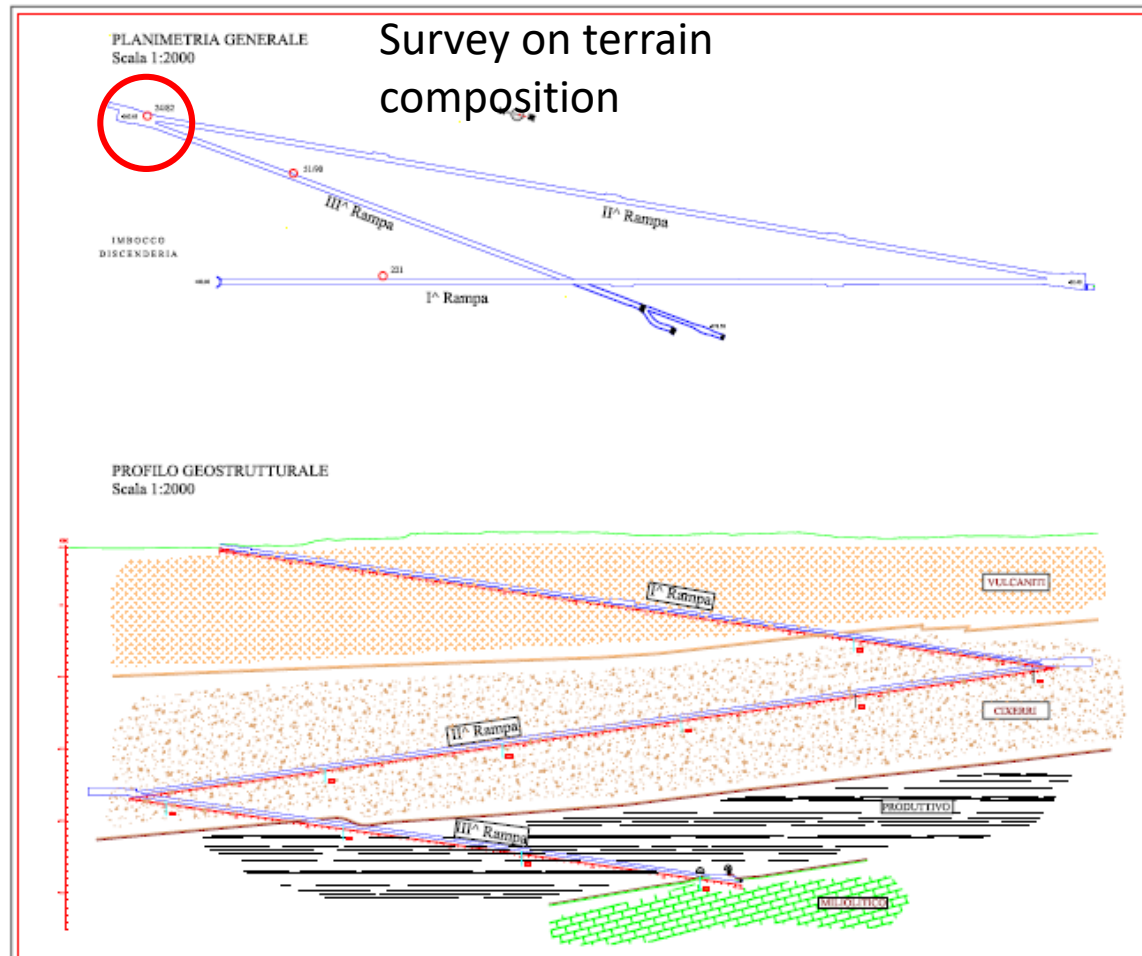

Study of the terrain above measurements sites (1)

- Possibility to find the exact position of the measurements sites thanks to QGIS layers (not yet) available from Carbosulcis S.p.A.
- Possibility to find the exact ground altitude a.s.l. thanks to data available from Regione Autonoma della Sardegna (<http://www.sardegnageoportale.it>)

Study of the terrain above measurements sites (2)

Geological data from Seruci site (a few km away)

Meters underground to meter water equivalent conversion

- Not so difficult to estimate the terrain composition, even with some big uncertainties
- But it requests very much time to recover and implement all terrain data
- A few important information are not yet available

Conclusions and perspectives

- 1 measurement done outside (we could repeat it at the end)
- 2 measurements done underground (174 m and 339 m)
- 1 ongoing at deepest level (512 m) with some (solvable) problems

Perspectives

- At least two other measurements at different depth
- Check on environmental stability with data from weather sensors
- Implement geological data and rescale depth in mwe
- Simulation of detector acceptance and, maybe, of physics (GEANT4?)
- Comparison with ASTRO data
- Any other idea?
