

The students of Altamura
from Liceo Cagnazzi and
Liceo Federico II of Svevia present:

MASTERCLASS

2025

Perrucci Vita, Tafuno Stella, Losurdo Rosita, Antonio Clemente, Giuseppe Frizzale, Nadia Belmesdal

ABOUT US...

We come from Altamura, a town located in Apulia.

Our schools are Liceo Classico Cagnazzi and Liceo Scientifico Federico II di Svevia, where we had the opportunity to take part to the EEE Project.

What did we do?

- Choosing the right fitting function is essential to compare data collected in different measurement.
- We tried fitting the rate as a function of latitude through different functions.

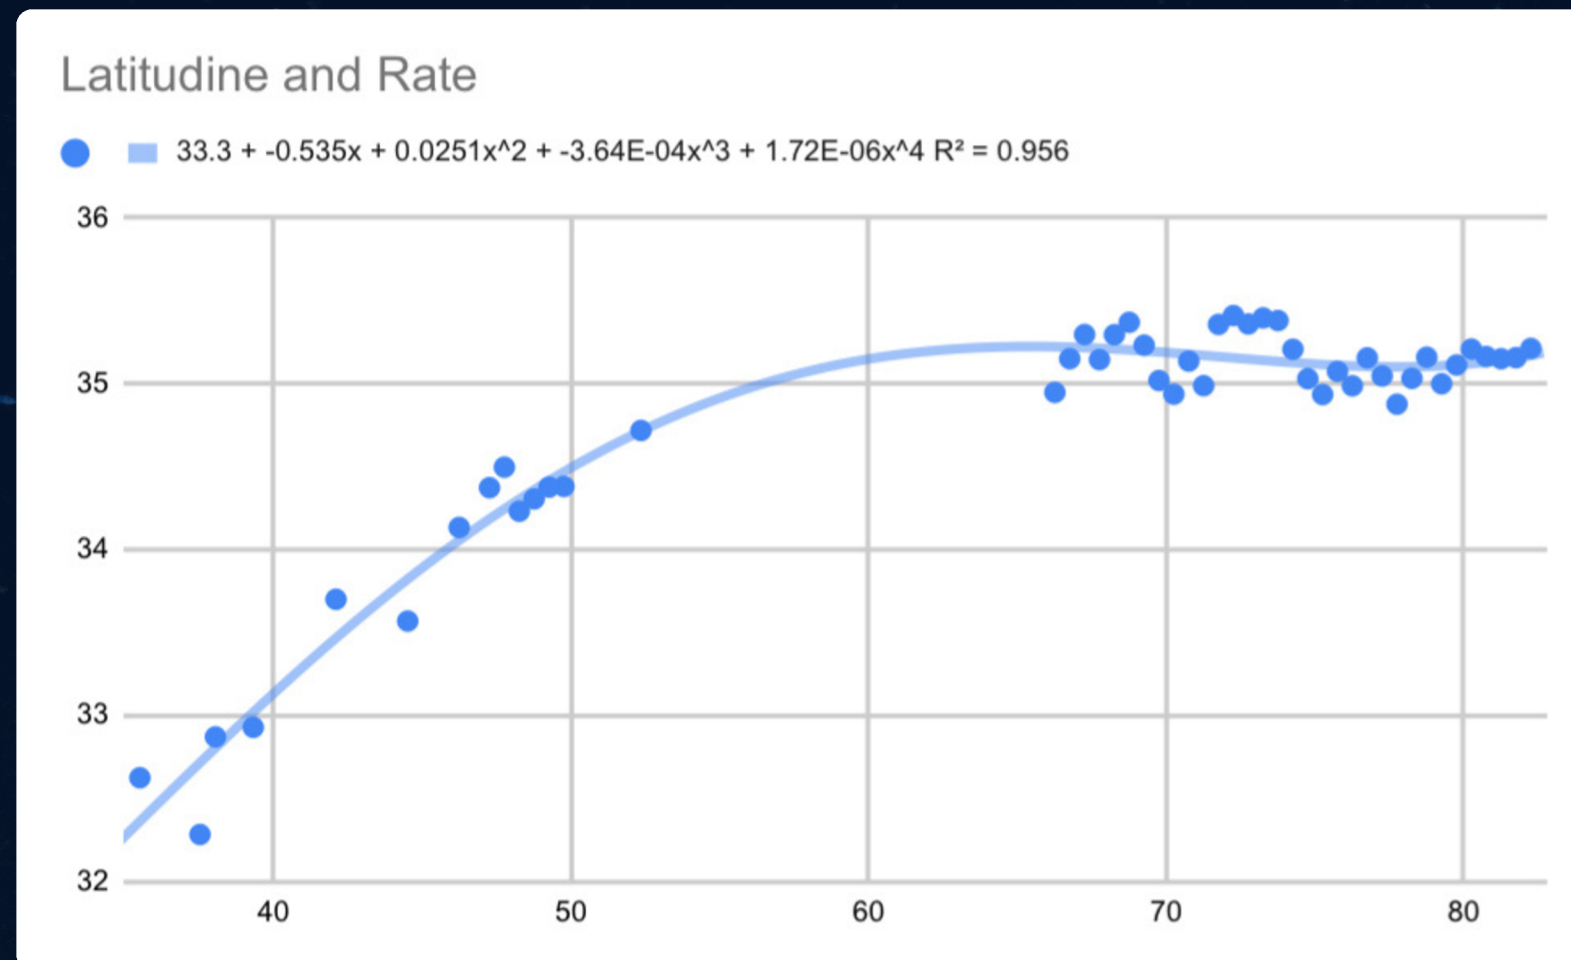

EXPONENTIAL

Latitudine and Rate

Almost negligible exponent coefficient (**1.33E-03**), thus resulting in an almost linear fit.

POLYNOMIALS

We have tried using third grade and fourth grade polynomials. The two curves behave in a very similar way, although the fourth grade polynomial shows a slightly better R^2 coefficient. Polynomials seem to be the best fitting curves for these data files.

Latitudine and Rate

● ■ $808 + -86.2x + 3.9x^2 + -0.0921x^3 + 1.2E-03x^4 + -8.22E-06x^5 + 2.31E-08x^6$ $R^2 = 0.963$

We also tried using higher-degree polynomials (6th and 8th degree) and found out that higher degree polynomials appear more susceptible to the lack of data in the latitude interval not covered by the measurements, presenting an unwanted depression.

Latitudine and Rate

● ■ $-454 + 113x + -9.6x^2 + 0.422x^3 + -0.0108x^4 + 1.69E-04x^5 + -1.58E-06x^6 + 8.16E-09x^7 + -1.79E-11x^8$ $R^2 = 0.963$

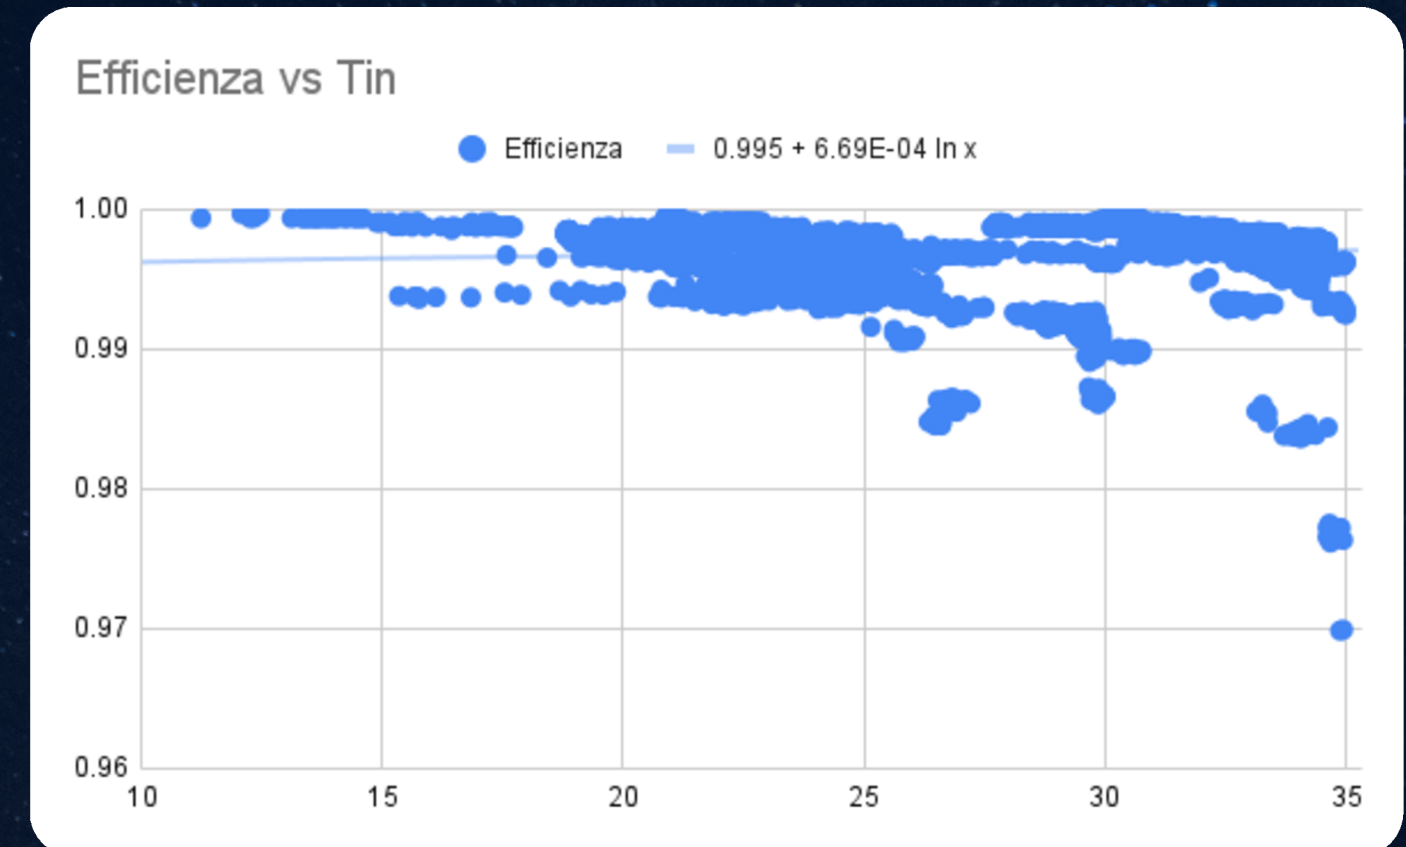

EFFICIENCY vs TEMPERATURE

We studied the relation between efficiency and temperature, in three different cases.

1. Difference between T_{in} and T_{out}
2. T_{out}
3. T_{in}

The graphics show no correlation between efficiency and temperature.

MOVING VS FIXED
